

FIRE IN THE SKY: SAMPLE STUDENT PRODUCTS

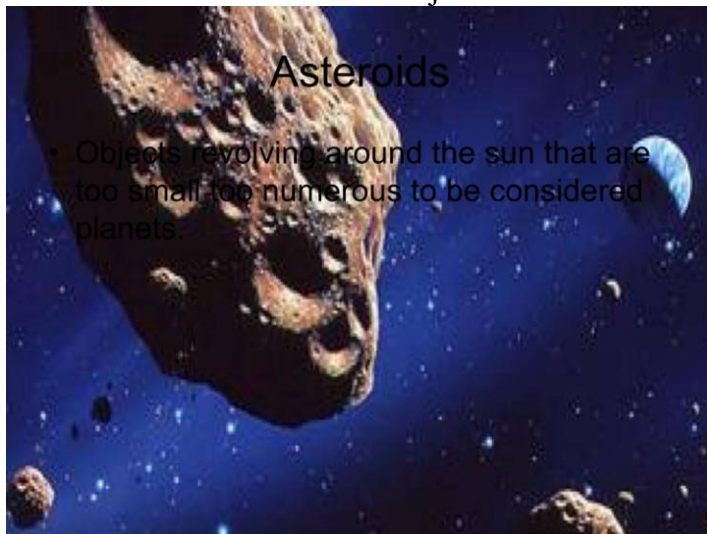

Powerpoint presentation: Exceptional Example

This is a slide from the presentation. It was good because they students used the ppt as a reference and did not include all of the information that they said during the presentation. They also included information about all of the Near Earth Objects, Mass Extinction, and analogies (someone jumping in a pool) to explain what would happen if a large object collided with the earth.

Powerpoint Presentation: Mediocre Example

This powerpoint was hard to read because each slide had a picture as the background. In addition, this group did not include all of the necessary information. They included some information about Near Earth Objects but did not include information about Mass Extinction.

Solar System Model: Exceptional Example

This model was a good example because it had all the planets and the comet from the case. The planets were made of styrofoam and painted.

Solar System Model: Mediocre Example

We do not have a picture of this completed project but the following is a description. The students were instructed to bring materials with them to complete their solar system model. This group did not bring materials so they were balling up paper towels and painting them to make the planets. The resulting model did not have all of the planets and was messy and disorganized.
